Drainage Area Plans

I. Project Description

The subject site (Tax parcel 13-51-1-5) is located in the Materials Processing and Manufacturing (MPM) zoning district. The site is bound by Phoenix Metals, Arley Wholesale, A&A Machinery, and Univar USA along Dean Sievers Place to the east, Sims Metal Management to the north, and Steel Road South to the west and south, in Falls Township. The attached USGS Quadrangle depicts the site location. The 32.30-acre site is currently undeveloped. The site is generally flat, but slopes toward the existing wetland at approximately one (1) percent. The majority of the site currently sheet flows directly to the existing wetland (POI-A), with a small portion of the site sheet flowing to an existing drainage swale along Dean Sievers Place and then to the wetland. The remaining portion of the site sheet flows to an adjacent property, TMP 13-51-1-6 (POI-B). The existing wetland system eventually discharges to the Delaware River, which is classified as WWF, MF in Chapter 93.

The project proposes a network of interconnected buildings covering approximately 107,100 square feet for the purpose of treating industrial waste. An additional $\pm 50,000$ square feet within the limit of disturbance has been reserved for future development. This future development area has been considered in the stormwater design, and is included in the calculations as impervious building area. Drive aisles capable of accommodating a WB-67 truck will be provided throughout the site, as well as a designated truck unloading area and a parking area for 73 vehicles. The truck unloading area is graded to be self-contained and will direct runoff collected in this area to the processing plant as an extra precaution against leaks or spills. The process tank farm in the large central island will also be self-contained and direct runoff to be processed. Runoff from area to be disturbed will be directed to one (1) stormwater basin.

II. Existing Conditions: Topography & Soils

Topographic information was obtained from a field survey performed by Gilmore & Associates, Inc. in March of 2014. Vertical Datum is NAVD88 and was established by Global Positioning System (GPS) with observations referenced to the TopCon TopSurv GPS Base Station Network.

Soils classification information for the project site was obtained from the Soil Survey of Bucks County, Pennsylvania, and is presented in Table 1. Urban Land (UfuB) is the only soil mapped within the area of disturbance.

Table 1: Existing Soils Classification Table

Symbol	SoilName	Rating	Slope
UfuB	Urban Land		0-8%
Na	Nanticoke-Hatboro Silt Loams	C/D	0-1%
W	Water		

III. Stormwater Management

The proposed stormwater management design for this project incorporates both structural and non-structural BMPs. The non-structural BMPs utilized in the design include minimization of the overall disturbed area to the maximum extent possible and limitation of the proposed impervious coverage to only what is needed for the proposed use. Limiting the impervious coverage and overall disturbed area reduces the composite CN value in the post-development condition and reduces runoff. Also, the existing drainage swale between the proposed development and Dean Sievers Place will be maintained to continue to direct off-site runoff to the existing wetland system. Further, a managed release basin with an impermeable liner is proposed to treat the stormwater from the disturbed area. After stormwater enters the basin through one (1) of two (2) endwalls, it will first infiltrate through two (2) feet of amended soils for water quality, then enter the perforated underdrain and slowly discharge through the hole drilled in the capped underdrain in the outlet control structure. The outlet control structure also has a rectangular orifice and grated top to mitigate peak flows in accordance with the Falls Township Stormwater Management Ordinance (Chapter 187). This basin will discharge to the existing wetland system via an endwall with a rip-rap apron sized in accordance with the 2012 PADEP Erosion and Sediment Pollution Control Program Manual. The discharge will then be dispersed over a fifty (50) foot wide level spreader to an area stabilized by existing brush in an effort to reduce the impact to the local wetland environment from a concentration of the site runoff.

PADEP has requested that infiltration not be included in the stormwater management design for this project. As such, an impermeable liner will be installed below the underdrain in the proposed basin to fully contain all runoff from the disturbed area.

The stormwater management design is based on the Soil Conservation Service (SCS) Method for runoff peak flow rates and volumes utilizing the Hydraflow Hydrographs computer software program. The proposed stormwater conveyance system design is based on the Rational Method utilizing the Hydraflow Storm Sewers computer software program. All inlets, storm sewer pipes, and the proposed stormwater basin have been designed to contain and convey the 100 year storm, exceeding standards set forth in the Falls Township Stormwater Management Ordinance (Chapter 187). Time of concentration calculations for the stormwater management design are attached. In order to comply with the ACT 167 Plan, the above stormwater management design criteria are based on the Falls Township Stormwater Management Ordinance (Chapter 187) adopted April 5, 2005.

A. Peak Flow Rate Analysis per §187-9(A)(2)

This site is located within District C, which requires post-development runoff rate control as follows:

District	Post-Development Design Storm		Pre-Development Design Storm
C	2-year	reduced to	1-year
	5-year	reduced to	2-year
	100-year	reduced to	50% of 100-year

Runoff rate will be controlled in accordance with the requirements above per the following table:

Table 2: Runoff Peak Discharge Rate Summary (cfs)

Condition	1-year	2-year	5-year	10-year	25-year	50-year	100-year
Pre-Development POI-A	4.80	8.54	15.00	21.32	28.06	33.33	40.55
Pre-Development POI-B	1.15	2.04	3.57	5.07	6.66	7.91	9.62
Post-Development POI-A	2.03	3.09	4.84	7.28	10.38	12.30	14.75
Post-Development POI-B	0.19	0.29	0.45	0.61	0.78	0.91	1.08

B. Water Quality Analysis per §187-17

The Falls Township Stormwater Management Ordinance requires that 90% of the average annual rainfall be treated over the developed portions of the site per the following equation:

$$WQv = [(P) \times (Rv) \times (A)] \div 12$$

Where:

WQv = water quality volume (acre-feet)

P = rainfall amount equal to 90% of events producing this rainfall (inches)

P = 2.04 inches for PennDOT Region 5

A = area of project contributing to the water quality BMP (acres)

Rv = 0.05 + [0.009 × (I)] where I is the percent of the area that is impervious surface
(impervious area ÷ A × 100%)

The required WQv for this site is:

$$WQv = [(P) \times (Rv) \times (A)] \div 12$$

$$Rv = 0.05 + [0.009 \times (I)]$$

$$I = \text{impervious area} \div A \times 100\%$$

$$I = 8.09 \div 13.40 \times 100\%$$

$$I = 60.4$$

$$Rv = 0.05 + [0.009 \times 60.4]$$

$$Rv = 0.59$$

$$WQv = [(2.04 \text{ in}) \times (0.59) \times (13.40)] \div 12$$

$$WQv = 1.34 \text{ acre-feet} = 58,370 \text{ cf}$$

The WQv provided by the managed release basin is equal to the volume that flows to the basin and stays below the lowest basin outlet invert. This volume will infiltrate through the amended soils in the managed release basin to achieve the required water quality and discharge through the orifice in the underdrain located in the outlet control structure. Since

the maximum water surface for the 2-year storm is below the lowest orifice invert, the entire runoff volume for the 2-year storm that is directed to the managed release basin will be treated to the required water quality. The runoff volume from the 2-year storm event that flows to the basin is 94,641 cubic feet per the Soil Conservation Service (SCS) Method utilized by the Hydraflow Hydrographs computer software program.

94,641 cubic feet provided > 58,370 cubic feet required

C. Analysis of Dean Sievers Place Channel

There are two (2) crossings proposed across the existing channel in the drainage easement adjacent to Dean Sievers Place. The existing and proposed drainage area and Rational Method coefficient were calculated for each proposed culvert crossing, see attached exhibits and Rational Method coefficient calculations. As shown in the attached Hydraflow Hydrographs computations, the proposed condition results in less runoff to the proposed headwall locations.

IV. Erosion and Sediment Control

The following measures shall be implemented to minimize erosion and sediment pollution created by site construction:

- A. **Stabilized Construction Entrance(s)** – Temporary construction entrances will provide stable access routes to the site, and will aid in cleaning mud from vehicle tires during ingress and egress to and from the site.
- B. **Compost Filter Socks** – Compost filter socks will be used to filter sediment from small overland (sheet) flow areas and along the toe of slope of soil stockpiles. Rock filter outlets shall be implemented by the Contractor in low points along the compost filter socks where concentrated flow can occur.
- C. **Inlet Protection** – Installation of inlet protection devices shall be utilized to protect the existing inlets and proposed inlets from receiving increased sediment loads due to construction related activities.
- D. **Temporary Seeding and Mulching** – Disturbed areas which will be “unworked” shall immediately receive a temporary seed mixture and mulch as shown on the plan. In addition, soil stockpile areas are to be seeded and mulched with a temporary seed

mixture to promote rapid vegetated stabilization.

- E. Permanent Seeding and Mulching – Disturbed areas at final grade are to receive a permanent seed mixture and mulch to promote permanent stabilization as shown on the plan.
- F. Limited Area of Disturbance – No site clearing or grading is proposed which is not essential to the construction of the project. Significant open space areas of the site will remain undisturbed.

V. Maintenance

The Owner of the Dean Sievers Place site shall maintain the stormwater management system. Maintenance shall include removal of debris from all inlet locations, as well as removal of any obstructions that may enter the stormwater basin. Falls Township shall also reserve the right to enter the site for the purpose of inspection of these facilities to ensure that the Owner is maintaining the design integrity.

VI. Qualifications:

The design of the stormwater management facilities has been completed by James Hersh, P.E. of Gilmore & Associates, Inc. The firm has completed numerous stormwater management projects in Bucks County since 1973.

EMERGENCY SPILLWAY DESIGN

RIP-RAP APRON DESIGN

STANDARD WORKSHEET
Rip-Rap Apron Outlet Protection

PROJECT NAME: Elcon Recycling
 LOCATION: Falls Township
 PREPARED BY: MRZ DATE: 4/15/2019
 CHECKED BY: JJH DATE: 4/15/2019

METHODOLOGY:

Utilize PA D.E.P. *Erosion and Sediment Control Manual* to construct a Rock Apron at culvert, endwall, headwall or channel outfalls. First, tailwater condition must be determined (minimum or maximum). Second, with a known discharge, determine D50 rock size and length of apron "La". Third, determine the width and thickness of the apron. Lastly, ensure the permissible velocity of the rock size chosen is not exceeded by the velocity of the discharge entering the apron.

Equations Utilized:

Minimum Tailwater Condition: $W2 = 3do + La$
 Maximum Tailwater Condition: $W2 = 3do + 0.4La$
 Blanket Thickness: $T = 1.5 \cdot D_{max}$
 Discharge (Q) and Velocity (V) - obtained from the 100 Year Storm
 do = pipe diameter
 Width 1 = initial width of apron at end of structure
 Width 2 = terminal width of apron, W2

Flows from Hydraflow
Computations

PennDOT Publication 408, Section 703.2(c), Table C

Tables 6.6 and 6.7 should be placed on the plan drawings of all sites where riprap channel linings are proposed.

TABLE 6.9
Recommended n Values to be Used with Manning's Equation When Doing Stability
Analyses of Receiving Streams

Design values should be utilized unless documentation is provided
(narrative/calculations) to show that another value within the minimum and maximum
range is appropriate.

Surface	Min.	Design	Max.
Asphalt Lining		0.015	
Brick in cement mortar; brick sewers	0.012	0.015	0.017
Concrete-lined channel	0.012	0.015	0.018
Cement-rubble surface	0.017		0.030
Neat cement surfaces	0.010	0.012	0.013
Plastic-lined channel	0.012		0.014
Shotcrete	0.016		0.017
Asbestos Cement Pipe		0.009	
Concrete pipe	0.012	0.015	0.016
Vitrified Clay Pipe	0.010	0.013	0.017
Common-clay drainage tile	0.011	0.012	0.017
Semi-circular metal flumes, smooth	0.011		0.015
Corrugated	0.023	0.025	0.030
Channels and ditches			
Earth, straight and uniform	0.017	0.023	0.025
Rock cuts, smooth and uniform	0.025	0.030	0.035
jagged and irregular	0.035	0.040	
Dredged earth channels	0.025	0.028	0.033
Earth bottom, rubble sides	0.028	0.030	0.035
Natural Streams			
1. Clean, straight bank, full stage no rifts or deep pools	0.025		0.033
2. Same as 1, but some weeds and stones	0.030		0.040
3. Winding, some pools and shoals, clean	0.033		0.045
4. Same as 3, lower stages, more ineffective slope and sections	0.040		0.055
5. Same as 3, same weeds and stone	0.035		0.050
6. Same as 4, stony sections	0.045		0.060
7. Sluggish river reaches, rather weedy or with very deep pools	0.050		0.080
8. Very weedy reaches	0.075		0.150
